High-Pressure Cleaning Solutions for MINING-DRILLING

Nothing cleans faster, better and easier than a Landa pressure washer. Surprisingly, pressure washers also conserve water, using only a fraction of the water that is typically used when cleaning with a garden hose. Selecting a power washer is like painting—the bigger the brush, the faster you get the job done. Pressure (PSI) determines the width of the spray. High water volume (GPM) cleans more effectively. Both high PSI and GPM deliver an ideal knock out punch.

WHY hot water cleans faster and better

It's a fact as obvious and elementary as washing dishes in the kitchen sink: **hot water cleans faster and better than cold.**

How? Higher temperatures cause water molecules to collide with each other creating energy that in turn causes grease and grime to break free from the surface to which they are attached.

Hot water power washing, with water temperatures up to 200°F, also produces a

sanitizing advantage especially important to the medical and food industries.

Over the years, it has been determined that heat isn't the only element of cleaning that can impact effectiveness. Agitation (water volume and pressure) and soap are also crucial.

Hot water pressure washers bring together a perfect balance of water agitation (GPM and PSI), heat-friendly detergents and heated water to create the ideal cleaning machine.

WHERE to get support

Landa's high-pressure cleaning equipment is backed by a network of more than 200 authorized sales and service centers, trained to provide complete needs analysis, operator instruction and service support
